Odyssey Epic

The internet has made transactions faster and more cost effective. But the cost of enrolling into services and the time spent in validating customers still remain high. This applies to practically every financial service like bank accounts, credit cards, buying an insurance policy or a depository account.

The reason for this is the Know Your Customer (KYC) norms that are necessary in a world that harbors terrorism, money laundering and other similar problems. The traditional comfort feeling arising out of paper also plays a role.

The regulatory norms and organization's own need for customer identification cannot be done away with. But these processes can be made faster, almost paperless and inexpensive.

The advances in mobile phones and the cameras built into them, the wider reach of mobile networks and the world-class digital signature technology of Odyssey for mobile phone devices together make this possible.

This comes to you as a revolutionary product, **Odyssey** Epic

How it works?

The identity proof and other documents that are traditionally obtained as paper copies from a subject are instead captured as direct digital images using the mobile camera. In addition, any other needed details are entered by the agent in the presence of the customer.

All of these are put together as a single PDF document and digitally signed by the agent using the Epic client software on the phone. The document is then uploaded to the service provider through GPRS / 3G.

The behavior of the Epic client software can be customized by a simple template to suit any kind of requirement.

ODYSSEY TECHNOLOGIES LTD

GPRS/3G

The Epic server at the other end receives and verifies the signature on the document. It also unpacks the data and images and injects them into any existing workflow or database.

The Epic server also sports a web based administration module that enables the data so captured to be easily managed, used and archived.

Operating Environment

Odyssey Epic Server software	Epic client software for mobile phones running
Microsoft Windows Server 2003 and above	Winmobile 6.0 and above Android 2.0 and above

- Compatible smart card that can be inserted into the SD memory card slot of the mobile
